Executive Summary
The 2022 Orthopaedic In-Training Examination (OITE) was administered to 4,963 residents across 232 national and international orthopaedic residency programs from November 4, 2022 through November 13, 2022. The OITE is a 275-item, multiple choice, computer-based examination that covers 10 content domains representative of the established principles and conventional procedures and treatment modalities in orthopaedic surgery. Since 2020, the AAOS has offered the option for two proctored administration models: in-person group testing or individual remote testing.

Scoring and reporting is conducted by the American Academy of Orthopaedic Surgeons and results are made available to the residency program directors for dissemination to the residents. Score reports include overall program performance, program year (PGY) performance and individual examinee performance. In 2020, the AAOS adopted a new standard for performance comparisons at all levels (program, PGY, and individual) to better align with the direction of education in US orthopaedic residency programs. To maintain equity in the comparison of performance outcomes and percentiles, the Accreditation Council for Graduate Medical Education (ACGME)-accredited orthopaedic residency programs were used as the reference group. All score comparisons and percentiles point to the ACGME-accredited program results and all programs (domestic and international) are compared to the same reference group.

As they have since 2020, the AAOS and the American Board of Orthopaedic Surgery (ABOS) collaborated on the development of a collection of examination items that were included on both the 2022 ABOS Part I Certifying Examination and the 2022 AAOS OITE. The purpose of including a set of common items on both examinations was to identify the score on the 2022 OITE that approximately corresponds to the minimum passing performance level on the ABOS Part I Certifying Examination. The score estimate is based on a relatively small sample of shared items and is not intended to be predictive of future performance on the ABOS Part I Examination but serve as a rough benchmark to help guide education and examination preparation.

Results from the 2022 administration show a progression of knowledge as the residents advance in their training. Composite mean scores increase significantly across the PGY program (see ANOVA).

Test Specifications
Purpose
The purpose of the Orthopaedic In-Training Examination (OITE) is to provide evidence of the orthopaedic surgeon’s scope of knowledge throughout their training in support of educational advancement. Since 1963, the American Academy of Orthopaedic
Surgeons (AAOS) has developed the Orthopaedic In-Training Examination (OITE) to assess resident knowledge in eleven primary content domains as defined by the OITE blueprint.

**Intended Population**
The OITE is made available to all United States Accreditation Council for Graduate Medical Education (ACGME) and American Osteopathic Association (AOA) accredited orthopaedic residency programs as well as Canadian and International (outside North America) programs by request.

The examination is utilized throughout the 5 post-graduate years (PGY) representative of the ACGME training criteria. However, among other groups (International), the number of PGYs may vary.

**Blueprint**
In 2020 the AAOS adopted a new blueprint, developed by the American Board of Orthopaedic Surgery, that was also in place for 2022 test development and examination administration. The 2022 OITE content consisted of 10 primary subject matter domains as outlined in the blueprint (Table 1). The content distribution aligned with historical examinations and is reviewed annually by the Education Assessments and Examinations Committee.

**Examination Overview**

**Subject Matter Experts**
Physician subject matter experts (SMEs) are appointed to the OITE Examination Committee by the Committee Appointment Program Committee, then ratified by the Board of Directors. The appointments cover a 3-year term and committee members may request reappointment near the end of their first term. SMEs are routinely surveyed
regarding their focused expertise and every attempt is made to align a physician’s
area of practice with appropriate content in the OITE. Based upon the content needs,
assignments are issued to the SME groups. All SMEs receive training in item development
focusing in on the AAOS’ style for item writing as well as best practice design
recognized by the standards in place for high-stakes and educational testing. Appendix A lists the SME contributors and reviewers for the 2022 OITE.

Item Development
SMEs author items in the AAOS item bank and authoring tool, ExamDeveloper®. Item
writers complete their assignments in the tool and are required to provide detailed
summaries of the topics covered in support of content validity. At least two current,
relevant and peer reviewed/recognized sources of references are required for each
test item as well as an in-depth discussion explaining the justification for the correct/best
answer and explanation addressing the incorrect answer options. The extensive
validation of each item provides the foundation for the content validity of the
examination and supports the fundamental purpose of the OITE, considering the
educational aspects of orthopaedic residency training.

Items are reviewed by the examination sub-committees prior to convening as a group
to make decisions and recommendations regarding each item. The SME sub-
committee members enter comments and suggestions for each item collection they
are assigned to review. The group meets to address the collective comments and
makes final edits to items worthy of retaining and including in the examination. On
occasion, items are sent back to the authors for additional components (images,
expanded discussion) and are reviewed upon completion of the requested additions.
Each item is coded to a content domain and cognitive level and validated during the
review process.

After the collection of items for each domain have undergone a series of reviews, a
smaller committee (OITE chair and leads in each subject area domain) convene to
assemble and approve the final form of the OITE. Currently, only one form is used across
all PGY programs.

A similar development and review processes are followed for the collection of items
shared by the ABOS Part I examination and the OITE. Each item is reviewed by a group
of subject matter experts, revised as needed and coded to the appropriate content
domain. The shared items included in the examination are mapped to the ABOS
blueprint in consideration of the required overall compliance with content distribution.

Item Formats
OITE item format is four part multiple-choice, with a single correct/best response key
and three to four competing and compelling distractors (non-correct options). The
items may present as short clinical cases (vignettes) or straightforward knowledge-
based content. SMEs may include images, videos, or other stimuli (tables, charts, graphs) to supplement targeting the construct being tested. All items are stand-alone, meaning they are not dependent on any other items in terms of sequence, association, or content.

Administration

In 2022, the OITE was available for administration under two models, the traditional, in-person, group testing and remote testing and proctoring. The OITE in-person, group administrations were coordinated and proctored by each residency program. AAOS provided detailed instructions and guidelines to the residency programs regarding testing conditions, proctoring and requirements for the technical (hardware and bandwidth) components of the administration. The remote testing and proctoring administrations were coordinated with a vendor that provided services for the test administration which included audio and video monitoring throughout the examination session. Residents were provided with instructions to download a secure browser in advance of the examination. In addition, a sample test was made available to all residents testing remotely a few weeks in advance of the OITE to ensure access was achieved to the server in advance of the live examination.

AAOS scheduled a ten-day window in November to cover the OITE administrations nationally and internationally. The testing window for the 2022 administration was November 4-13.

The examination is a 275-item multiple-choice item test and opens with a welcome from the Exams and Assessments Chair (see Appendix B). Residents/examinees may use up to 7 (seven) hours of testing time to complete the OITE. The examination is assembled in two sections. Residents have up to 3.5 hours of testing time to complete each section. During testing, examinees may flag items to review and are permitted to change answers. When finished with Section I, examinees are required to verify completion and submit their answers. Once completed, examinees are no longer permitted to access the test items to review or change answers. The same process is followed for the second section of the examination, with an opportunity to flag items to review, change answers, and verify completion of the examination. Prior to the delivery of the examination, examinees must review and accept the AAOS confidentiality/non-disclosure statement as well as participate in the pre-exam tutorial. The tutorial provides instruction on the layout, response options, and timing of the OITE. In addition, the tutorial displays how to enlarge images and play (replay) video clips.

Once the examination is complete, examinees are invited to respond to a brief survey relating to their testing experience.
**Use of Scores**

The OITE is a comprehensive examination designed to facilitate knowledge assessment in established principles and conventional procedures and treatment modalities in orthopaedic surgery. Orthopaedic residency programs use the OITE performance outcomes at the individual and programmatic levels to support orthopaedic resident education through study, research, discussion, review, and assessment.

**Construct Irrelevant Variance**

**Fairness Review**

During their training, SME item writers and reviewers are instructed to ensure that items are free from any detectable bias that could unduly advantage or disadvantage the test taker based upon individual characteristics. Careful attention to ensure that the construct being targeted is free from bias alleviates construct-irrelevant variance in the interpretation of scores.

**Scoring Process**

**Item Analysis and Key Validation**

Prior to scoring, an analysis of item performance and key validation study is conducted. Generally, items displaying negative discrimination (or point measure), proportion correct (p-value) of less than 0.20 or demonstrating evidence of a mis-key or double key were reviewed by the SMEs. Results data from the ACGME-accredited PGY 4 and PGY 5 testing cohorts were used to conduct the item analysis and key validation.

On occasion, an item may be determined to be mis-keyed and in that case, the item would be re-keyed and retained in the final scoring. Items that are determined to be flawed in any way (double key, not targeted, no longer relevant or accurate) are removed from scoring. For the 2022 OITE, 41 items were flagged for SME review and 11 items were removed from scoring for a final item count of N=264.

**Classical and IRT Scoring**

The AAOS scores the OITE using a classical scoring model (raw number correct) and reports the raw score, mean, standard deviation and percentile rank (individual and program). An extension of the scoring was conducted using a Rasch (item response theory) model to place the examinee performance outcomes and item difficulty measures on the same (logit) continuum. The Rasch model provides generalizability across samples and items, produces an ordered set of items, and identifies poorly functioning as well as unexpected responses. Examinees and items can be rank ordered while the interval between the measures is scalable and subject to richer interpretation than the classical model.2,3

1 One ACGME student did not have Program Year listed in the data; One Non-ACGME student had Program Year 6 listed in the data. Therefore, totals in this table do not add up to those in Table 2.

ANOVA

An analysis of variance (ANOVA) was conducted to test the null hypothesis that there is no significant difference between mean scores across residency programs designated by program year. ACGME-accredited program data was used to conduct a comparison of mean scores across all PGY cohorts.
Results
The residency program year has significant influence on the overall OITE score, $F(4,4490)=1533.33$, $p<0.001$ (Table 4)

**Item Resident Distribution**

The following figures show the distribution of examinee ability estimates and item difficulty estimates on the Rasch interval scale for the PGY cohorts. The mean item difficulty is centered at zero. Measures to the left (negative) represent measures that align with “easier” items with the easiest items at the far left of the continuum. Measures to the right of the mean, represent items that increase in difficulty for the residents as the scale moves further right. The distributions show the alignment between candidate ability and item difficulty. There are a number of items that tested very easy (left end of lower scale) across all cohorts. These items contribute minimally to measurement precision (all or nearly all test-takers scored correct) and likely influence reliability estimates (see Reliability). The diagrams are used as a component of exam review and are not intended to suggest any intentional effort to increase the difficulty of the test items.

**Figure 1 PGY 5**

**Figure 2 PGY 4**
Reliability
Test form reliability is a measure of internal consistency of the examination and more importantly the magnitude of measurement error. Reliability measures are typically reported on a scale from 0-1. In educational assessment, reliability may be interpreted as the confidence that the scores accurately and consistently measure the knowledge of the test-takers.

KR20 reliability measures the repeatability of raw scores and may be affected by the overall test difficulty, number of items on the test, items that did not discriminate and the spread of scores. The Rasch Person Reliability Index produces a measure indicating how repeatable the measures are for the sample. There is good evidence to show the reproducibility of outcomes if the same set of items were tested in similarly able populations of examinees. The reliability estimates are acceptable for an educational examination.
The standard error of measurement (SEM) estimates the variation in test scores within a sample of test-takers. Table 6 shows the reliability estimates and SEM across the five testing cohorts.

ABOS/AAOS Linking Study

The American Board of Orthopaedic Surgery (ABOS) and the American Academy of Orthopaedic Surgeons (AAOS) collaborated on the development of a collection of examination items (questions) that were included on both the 2022 ABOS Part I Certifying Examination and the 2022 AAOS Orthopaedic In-Training Examination (OITE).

The purpose of including a set of common items on both examinations was to identify the score on the 2022 AAOS OITE that approximately corresponds to the minimum passing performance level on the ABOS Part I Certifying Examination. This approximation is based on a relatively small sample of shared items and is not a guarantee of or predictive of future performance on the ABOS Part I Examination.

Based on the linking study, the score on the 2022 AAOS OITE that corresponds to the ABOS Part I minimal passing standard is 181 items or 68.6% correct. Many factors, including changing levels of knowledge and testing conditions, will impact one’s performance on the AAOS OITE and the ABOS Part I Examinations. This information is provided as a rough benchmark to help guide education and examination preparations. The number correct score and corresponding percent correct are applicable to the 2022 AAOS OITE only and should not be used to gauge performance on previous or future administrations of the OITE.

Linking Study Design

The shared items developed by ABOS and AAOS were pre-tested on the ABOS Part I Examination in July 2022. The item performance measures for each item were analyzed and reviewed by subject matter experts who made the final decision regarding which
items would be included on the 2022 AAOS OITE. Items that did not meet statistical specifications were eliminated from the linking study.

Responses to these shared items from PGY 5 residents in US residency programs who took the 2022 AAOS OITE and from candidates who took the 2022 ABOS Part I Certifying Examination were used in a linking study—a psychometric procedure to link two examinations that have items in common. Item calibrations for the shared items produced from the ABOS Part I Examination were used to estimate item measures on the AAOS OITE. The current passing standard for the ABOS Part I Examination was applied to the OITE final item measures to obtain an estimate of the number correct and corresponding percentage correct that were reflective of the ABOS Part I Examination minimum passing score.

Results
The results of applying the minimal passing standard to the ACGME-accredited PGY cohorts demonstrated remarkable findings in terms of performance.

Figure 6 Percentage of Scores Meeting or Exceeding the ABOS Part I Minimum Passing Standard
Recommendations

The following recommendations address test development and measurement considerations.

1. Review and revise (as necessary) the purpose of the OITE. It is important for test developers to fully embrace the fundamental purpose of an examination and execute the test development processes and test specifications to align with said purpose.

2. Review post-examination comments to support quality improvement.

3. Equate adjacent administration forms of the OITE. Under the current model of test form assembly, all items are released for public review. Not only does this contribute to an extensive amount of item development necessary from year to year, it prohibits the ability to equate the test forms with a common item set. Currently, the OITE form assembly does not consider any statistical parameters (i.e., form difficulty). Equating the OITE will provide for better interpretability of scores from year to year (See Test Equating Proposal).

4. Continue to expand the groups of SMEs who contribute to the item development process. As committee members become seasoned with the AAOS style and process of item development and review, they may be used in a greater capacity as mentors and reviewers.

5. Implement item response theory (IRT), Rasch scoring in addition to classical scoring. This scoring model compliments test equating and produces meaningful measurement of item and examinee performance on an interval scale. The Rasch model also provides generalizability across samples and items, produces an ordered set of items, and identifies poorly functioning as well as unexpected responses.

6. Evaluate item and person performance at the cohort level to help guide future item development. There are a significant number of items that tested extremely easy across all groups. This may be essential content that must be tested and thus it is of paramount importance to include the recommendations of the SMEs before eliminating items based solely on statistical outcomes.

7. Given the positive outcome from the dual model administration, the AAOS should offer the OITE in both testing formats for future administrations.

Summary

The 2022 OITE test development and analyses process align consistently with the standards set forth for professional, high-stakes examinations. The steps to define the purpose of the examination and use of scores, selection of SMEs, training, item development, review and validation follow rigorous standards set forth by the AAOS Education Assessments and Examinations Committee members.
The 2022 OITE provides key information relating to the progression of knowledge in the topics covered for orthopaedic residents across their educational trajectory. Educational exams by design should differentiate among cohorts that are categorized or distinguished by their place in the program. The 2022 OITE outcomes show that the examination measures what it is purported to measure as evidenced by the differences in scores among residents in training over time. The 2022 OITE data supports the expectation of growth over time by the presentation of composite scores that are significantly different across the PGY cohorts.

The significant efforts by the volunteer physicians whose contributions support the overall positive results and commendable outcomes of the 2022 OITE should be recognized for their essential role in the OITE test development process.

Assistant Professor, Department of Orthopaedic Surgery, Loma Linda University Medical Center, Loma Linda, California

Yi-Meng Yen, MD, PhD, FAAOS
Associate Professor, Children’s Hospital Boston, Department of Orthopaedic Surgery, Division of Sports Medicine, Child and Young Adult Hip Preservation Program, Boston, Massachusetts

*Denotes Committee Appointment
November 2022

Dear Residents and Colleagues,

On behalf of the Assessments and Examinations Committee, I would like to thank you for participating in this year’s examination.

Being the first such examination among all the medical specialties, this year marks the 59th administration of the Orthopaedic In-training Examination®.

Every year, the OITE® is created by a group of orthopaedic surgeons who are deeply committed to education through a rigorous peer-review process. While many topics in orthopaedic surgery lack conclusive evidence, many of our practices are based on sound medical principles and a consensus of experts. Sometimes, there may appear several correct answers to a test item, but each question has been vetted through this peer-review process to select the one best preferred response.

The Education and Assessments Committee is working with the ABOS to link the OITE and ABOS, Part I written Examination. The AAOS continues to work with the ABOS to improve the education of residents and the AAOS Fellowship.

With this and each subsequent administration, we strive to make the OITE® better. Thank you for being part of this year’s examination, and I hope that you find this to be an enriching educational experience.

Sincerely,

Norman Otsuka, MD, FAAOS
Chair, Assessments and Examinations Committee
